The dimensional theory of continued fractions

Jun Wu

Huazhong University of Science and Technology

Advances on Fractals and Related Topics,
Hong Kong, Dec. 10-14, 2012
Notation

- Continuity fraction: \( x \in [0, 1), \)
  \[
  x = \frac{1}{a_1(x) + \frac{1}{a_2(x) + \frac{1}{a_3(x) + \cdots}}} = \left[a_1(x), a_2(x), a_3(x), \cdots \right].
  \]

- Gauss Transformation: \( T: [0, 1) \to [0, 1) \) given by
  \[
  T(0) := 0, \quad T(x) := \frac{1}{x} - \left[\frac{1}{x}\right] \text{ for } x \in (0, 1),
  \]
  is called the Gauss transformation.

- Partial Quotients: For all \( n \in \mathbb{N}, \) we have
  \[
  a_1(x) = \left[\frac{1}{x}\right], \quad a_n(x) = \left[\frac{1}{T^{n-1}x}\right].
  \]
  \( a_n(x) \) \((n \geq 1)\) are called the partial quotients of \( x.\)
Convergents: Let

\[
\frac{p_n(x)}{q_n(x)} = [a_1(x), a_2(x), \cdots, a_n(x)], \quad n \geq 1
\]

denote the convergents of \( x \).

\( n \)-order Basic Intervals: For any \( n \geq 1 \) and \((a_1, a_2, \cdots, a_n) \in \mathbb{N}^n\), let \( I(a_1, a_2, \cdots, a_n) \) be the set of numbers in \([0, 1)\) which have a continued fraction expansion begins by \( a_1, a_2, \cdots, a_n \).

Gauss Measure: The Gauss measure \( G \) on \([0, 1)\) is given by

\[
dG(x) = \frac{1}{\log 2} \frac{1}{x + 1} dx.
\]

\( T \) preserves Gauss measure \( G \) and is ergodic with respect to \( G \).
Dirichlet’s Theorem, 1842: Suppose \( x \in [0, 1) \setminus \mathbb{Q} \). Then there exists infinitely many pairs \( p, q \) of relatively prime integers such that

\[
| x - \frac{p}{q} | < \frac{1}{q^2}.
\]

Khintchine’s Theorem, 1924: Let \( \varphi : \mathbb{R} \to \mathbb{R}_+ \) be a continuous function such that \( x^2 \varphi(x) \) is not increasing. Then the set

\[
\{ x \in [0, 1) : | x - \frac{p}{q} | < \varphi(q) \text{ i.o.} \frac{p}{q} \}
\]

has Lebesgue measure zero if \( \sum_{q=1}^{\infty} q \varphi(q) \) converges and has full Lebesgue measure otherwise.
Jarnik, 1929, 1931, Besicovitch, 1934: For any $\beta > 2$,

$$\dim_H \left\{ x \in [0, 1) : |x - \frac{p}{q}| < \frac{1}{q^\beta} \text{ i.o. } \frac{p}{q} \right\} = \frac{2}{\beta}.$$ 

Bugeaud, 2003: Bugeaud studied the sets of exact approximation order by rational numbers which significantly strengthens the result of Jarnik and Besicovitch.

Lagrange’s Theorem:

$$|x - \frac{p}{q}| < \frac{1}{2q^2} \implies \frac{p}{q} = \frac{p_n(x)}{q_n(x)} \text{ for some } n.$$ 

Moreover,

$$\frac{1}{(a_{n+1}(x) + 2)q_n(x)^2} \leq |x - \frac{p_n(x)}{q_n(x)}| \leq \frac{1}{a_{n+1}(x)q_n(x)^2}.$$
Thus for any $\beta > 2$,

$$\{x \in [0, 1) : |x - \frac{p}{q}| < \frac{1}{q^\beta} \text{ i.o. } \frac{p}{q}\}$$

$$= \{x \in [0, 1) : |x - \frac{p_n(x)}{q_n(x)}| < \frac{1}{q_n(x)^\beta} \text{ i.o. } n\}$$

$$\sim \{x \in [0, 1) : a_{n+1}(x) > q_n(x)^{\beta-2} \text{ i.o. } n\}$$

We concluding: The growth speed of the partial quotients $\{a_n(x)\}_{n \geq 1}$ reveals the speed how well a point can be approximated by rationals. In this talk, we shall concentrate on the sets of points whose partial quotients $\{a_n(x)\}_{n \geq 1}$ have different growth speed.
Borel-Bernstein Theorem, 1912: Let $\phi$ be an arbitrary positive function defined on natural numbers $\mathbb{N}$ and

$$F(\phi) = \{x \in [0, 1) : a_n(x) \geq \phi(n) \ \text{i.o.}\}.$$ 

If the series $\sum_{n=1}^{\infty} \frac{1}{\phi(n)}$ converges, then $\mathcal{L}^1(F(\phi)) = 0$. If the series $\sum_{n=1}^{\infty} \frac{1}{\phi(n)}$ diverges, then $\mathcal{L}^1(F(\phi)) = 1$. 

Jun Wu, Huazhong University of Sci. & Tech. 

The dimensional theory of continued fractions
Notation

- Good, 1941:
  \[
  \dim_H \{ x : a_n(x) \to \infty, \text{ as } n \to \infty \} = \frac{1}{2}.
  \]

- Hirst, 1970: For any \( a > 1 \),
  \[
  \dim_H \{ x \in [0, 1) : a_n(x) \geq a^n \text{ for any } n \geq 1 \} = \frac{1}{2}.
  \]

- Luczak, 1997: For any \( a > 1, b > 1 \),
  \[
  \dim_H \{ x : a_n(x) \geq a^{b^n}, \forall n \in \mathbb{N} \} = \dim_H \{ x : a_n(x) \geq a^{b^n}, \text{ i.o. } n \in \mathbb{N} \} = \frac{1}{b + 1}.
  \]

- Multifractal analysis:
  
  M. Pollicott, B. Weiss; M. Kessebohmer, B. Stratmann; A. Fan, L. Liao, Wang, Wu; T. Jordan; G. Iommi; ...
For general $\psi$, what are dimensions of the sets

$$E_{\text{all}}(\psi) = \left\{ x : a_n(x) \geq \psi(n), \forall \ n \in \mathbb{N} \right\}$$

and

$$F_{\text{i.o.}}(\psi) = \left\{ x : a_n(x) \geq \psi(n), \text{ i.o. } n \in \mathbb{N} \right\}$$
Wang and Wu (2008)

**Notation**

\[
\dim_H E_{all}(\psi) = \frac{1}{1 + b}, \quad b = \limsup_{n \to \infty} \frac{\log \log \psi(n)}{n},
\]

Let

\[
\liminf_{n \to \infty} \frac{\log \psi(n)}{n} = \log B, \quad \liminf_{n \to \infty} \frac{\log \log \psi(n)}{n} = \log b.
\]

- when \(1 \leq B < \infty\),

\[
\dim_H F_{i.o.}(\psi) = \inf \{s \geq 0 : P(-s(\log |T'| + \log B)) \leq 0\},
\]

- when \(B = \infty\), \(\dim_H F_{i.o.}(\psi) = 1/(1 + b)\),
Good (1941) also considered the general set. For any $B > 1$, let

$$d_B = \dim_H \{x \in [0, 1) : a_n(x) \geq B^n \ i.o.\}.$$ 

He gave the bound estimation on its Hausdorff dimension only but not the exact value. For any $s > \frac{1}{2}$, let $\theta(s) = 2^{-s}3^{-s} + 3^{-s}4^{-s} + \cdots$. Let $s_0$ satisfy $\theta(s_0) = 1$.

For any $s > 1$, let $\xi(s) = \sum_{n=1}^{\infty} n^{-s}$, Riemann’s zeta function.

- **Good, 1941:**
  - If $\frac{1}{2} < s < s_0$ and $B^{4s} < \theta(s)$, then $d_B \geq s$.
  - If $s > \frac{1}{2}$ and $B^s \geq \xi(2s)$, then $d_B \leq s$.
  - $d_B \to \frac{1}{2}$ as $B \to \infty$. 
Notation

Sketch of Proof : \( \{ x : a_n(x) \geq B^n, \ i.o.n \} \)

Upper bound :

For any \((a_1, \cdots, a_n)\), define basic interval :

\[ J_n(a_1, \cdots, a_n) := \{ x : a_1(x) = a_1, \cdots, a_n(x) = a_n, a_{n+1}(x) \geq B^{n+1} \}. \]

Then we get a cover of \( F_{i.o.} = \{ x : a_n(x) \geq B^n, \ i.o.n \} : \)

\[ F_{i.o.} \subset \bigcap_{N=1}^{\infty} \bigcup_{n=N}^{\infty} \bigcup_{a_1, \cdots, a_n \in \mathbb{N}} J_n(a_1, \cdots, a_n). \]

So, the Hausdorff measure can be estimated as

\[ \mathcal{H}^s(F_{i.o.}) \leq \liminf_{N \to \infty} \sum_{n=N}^{\infty} \sum_{a_1, \cdots, a_n \in \mathbb{N}} \left( \frac{1}{q_n^2(a_1, \cdots, a_n)B^{n+1}} \right)^s. \]
Lower bound:

Define a Cantor subset:

- \( \{n_k\} \) a largely sparse subsequence of \( \mathbb{N} \),

- \( \alpha \) a large integer.

Define Cantor subset

\[
E_B(\alpha) = \left\{ x : \begin{cases} 
1 \leq a_n(x) \leq \alpha, & \text{when } n \neq n_k; \\
 a_n(x) \in [B^n, 2B^n), & \text{when } n = n_k.
\end{cases} \right\}
\]

Result:

\[
\dim_H E_B(\alpha) = \inf \left\{ s \geq 0 : P_\alpha(-s(\log |T'| + \log B)) = 0 \right\},
\]

where

\[
P_\alpha(\psi) = \lim_{n \to \infty} \frac{1}{n} \log \sum_{1 \leq a_1, \ldots, a_n \leq \alpha} \exp(\psi(x) + \cdots + \psi(T^{n-1}x)).
\]
Lemma (Mauldin & Urbanski, 1996)

Let $f : [0, 1] \to \mathbb{R}$ be a function satisfying the tempered distortion condition, then

$$P(f) = \sup\{P_\Sigma(f) : \Sigma \text{ is } T \text{ invariant subsystem}\}.$$ 

$\varphi : [0, 1] \to \mathbb{R}$, write $S_n(\varphi)(x) = \psi(x) + \cdots + \psi(T^{n-1}x)$,

$$var_n(\varphi) := \sup_{a_1, a_2, \cdots, a_n} \{|\varphi(x) - \varphi(y)| : x, y \in I(a_1, a_2, \cdots, a_n)\}$$

- **Tempered Distortion Property**:

  $$var_1(\varphi) < \infty \text{ and } \lim_{n \to \infty} \frac{1}{n} var_n S_n(\varphi) = 0.$$
Generalizations

Note that
\[\frac{1}{a_{n+1}(x) + 1} \leq T^nx \leq \frac{1}{a_{n+1}(x)}.\]

So the growth rate of \(a_n(x)\) can also be given by the speed that \(T^nx\) approximate the point 0.

Shrinking target: For fixed \(y\), how about the size of the set
\[
\left\{ x : |T^nx - y| \leq \psi(n, x), \text{ i.o. } n \in \mathbb{N} \right\}?
\]

In particular, let \(f : [0, 1] \to \mathbb{R}_+\), define
\[
S_y(f) = \left\{ x \in [0, 1] : |T^nx - y| \leq e^{-S_nf(x)}, \text{ i.o. } n \right\},
\]
how about the size of \(S_y(f)\)?
Suppose we have a dynamical system \((X, T, \mu)\), where \(\mu\) is a \(T\)-invariant ergodic probability measure. Let \(A \subset X\) such that \(\mu(A) > 0\). Ergodic property implies that

\[
\mu\left( \bigcap_{m=1}^{\infty} \bigcup_{n=m}^{\infty} T^{-n}(A) \right) = 1,
\]

that is, \(\mu\) almost every \(x \in X\) will visit \(A\) an infinite number of times. This raises the question of what happens when we allow \(A\) to shrink with respect to time. How does the size of \(\bigcap_{m=1}^{\infty} \bigcup_{n=m}^{\infty} T^{-n}(A(n))\) depend upon the sequence \(\{A(n)\}_{n \geq 1}\) ?

The shrinking target problem initialed by Hill and Velani (1995) which concerns “what happens if the target shrinks with the time and more generally if the target also moves around with the time.”
Sets of the form $S_y(f)$ arise naturally in Diophantine approximation.

Given $\beta > 2$, let

$$J(\beta) = \{ x \in [0, 1) : |x - \frac{p}{q}| < \frac{1}{q^\beta} \text{ i.o. } \frac{p}{q} \}$$

$$= \{ x \in [0, 1) : |x - \frac{p_n(x)}{q_n(x)}| < \frac{1}{q_n(x)^\beta} \text{ i.o. } n \}$$

$$\sim \{ x \in [0, 1) : a_{n+1}(x) > q_n(x)^{\beta-2} \text{ i.o. } n \}.$$ 

Choose $f = \log |T'|$. In this case, we have $S_n(f) = \log |(T^n)'|$ and $|(T^n)'(x)| \approx q_n(x)^2$.

For each $\alpha > 2$, let $f_\alpha = (\frac{\alpha}{2} - 1)f$. Then for any $2 < \alpha < \beta < \gamma$, it is easy to see

$$S_0(f_\gamma) \subset J(\beta) \subset S_0(f_\alpha).$$

Thus

$$\dim_H J(\beta) = \frac{2}{\beta} \iff \dim_H S_0(f_\beta) = \frac{2}{\beta}, \text{ for any } \beta > 2.$$
The shrinking target problem in the system of continued fractions:

**Li, Wang, Wu and Xu (2010)**

Let \( f : [0, 1] \to \mathbb{R}_+ \) be a function satisfying the tempered distortion condition, then

\[
\dim_H S_y(\psi) = \inf \{ s \geq 0 : P(-s(\log |T'| + f)) \leq 0 \},
\]

For \( B \geq 1 \), take \( f = \log B \), we have

**Wang, Wu (2008)**

\[
\dim_H \{ x \in [0, 1) : a_n(x) \geq B^n \ i.o. \} = \inf \{ s \geq 0 : P(-s(\log |T'| + \log B)) \leq 0 \}.
\]
Lemma (A transfer principle : Relation of cylinders and balls)

Let $B(z, r)$ be a ball with center $z \in [0, 1]$ and radius $0 < r < e^{-4}$. Then there exist integers $t \leq -4 \log r$, $b_1, \cdots, b_{t-1}$ and $b_t, \overline{b}_t$ such that $3 \leq b_t < \overline{b}_t$ and the family

$$G = \left\{ I(b_1, \cdots, b_{t-1}, b_t) : b_t < b_t \leq \overline{b}_t \right\}$$

satisfies the following three conditions.

(1) All the cylinders in $G$ are of comparable length:

$$1/24 \leq \frac{|I(b_1, \cdots, b_{t-1}, b_t)|}{|I(b_1, \cdots, b_{t-1}, b'_t)|} \leq 24, \text{ for all } b_t < b_t, b'_t \leq \overline{b}_t.$$

(2) All the cylinders $I$ in $G$ are contained in the ball $B(z, r)$.

(3) The cylinders in $G$ pack the ball $B(z, r)$ sufficiently; that is

$$2r \geq \sum_{b_t < b_t \leq \overline{b}_t} |I(b_1, \cdots, b_{t-1}, b_t)| \geq \frac{r}{4^6}.$$
Localized Jarnik-Bescovitch theorem

Suppose $\tau : [0, 1] \to [2, \infty)$ be a continuous function, let

$$J(\tau) = \left\{ x \in [0, 1) : \frac{|x - \frac{p}{q}|}{q^{\tau(x)}} < \frac{1}{q^x} \right\} \text{ i.o. } \frac{p}{q}.$$ 

Barral and Seuret, 2011:

$$\dim_H J(\tau) = \frac{2}{\min\{\tau(x) : x \in [0, 1]\}},$$

this result extends the classical Jarnik-Bescovitch theorem.
Let $\eta : [0, 1] \to [0, \infty)$ be a continuous function, define

$$L_\eta(f) := \left\{ x : a_{n+1}(x) \geq e^{\eta(x)} S_n f(x), \text{ i.o. } n \in \mathbb{N} \right\}$$

Remark: When $\eta(x) = \frac{\tau(x)}{2} - 1$ and $f(x) = \log |T'(x)|$, then

$$L_\eta(f) \sim J(\tau).$$

**Wang, Wu, Xu(2012)**

Let $\eta : [0, 1] \to [0, \infty)$ be a continuous function and $f : [0, 1] \to \mathbb{R}_+$ be a function satisfying the tempered distortion condition, then

$$\dim_H L_\eta(f) = \inf \left\{ s \geq 0 : P \left( -s \left( \log |T'| + f \min_{x \in [0,1]} \eta(x) \right) \right) \leq 0 \right\}.$$
General settings of the shrinking target problems: How about the size of the following type of sets?

- **Fixed target problems:**
  \[ S_y(\psi) := \left\{ x : |T^n x - y| \leq \psi(n, x), \ i.o. \ n \in \mathbb{N} \right\} \]

- **Recurrence properties:**
  \[ R(\psi) := \left\{ x : |T^n x - x| \leq \psi(n, x), \ i.o. \ n \in \mathbb{N} \right\} \]

- **Covering problems:**
  \[ C(\psi) := \left\{ y : |T^n x_0 - y| \leq \psi(n, x_0), \ i.o. \ n \in \mathbb{N} \right\} \]
