TA: LEE, Yat Long Luca
Email: yllee@math.cuhk.edu.hk
Office: Room 505, AB1
Office Hour: Send me an email first, then we will arrange a meeting (if you need it).
Tutorial Arrangement:

- (1330 1355/ 15:30 15:55): Problems.
- (1355 1415/ 15:55 16:15): Class exercises.
- (1415 1430/ 16:15 16:30): Submission of Class Exercise via Gradescope.
- (1430 1530/ 16:30 17:30): Late submission period.

# 1 Line Integrals of Vector Fields

#### 1.1 Vector Fields

**Vector fields:**  $\mathbf{F} : \mathbb{R}^n \longrightarrow \mathbb{R}^m$  given by  $\mathbf{F}(x_1, ..., x_n) = (F_1(x_1, ..., x_n), ..., F_m(x_1, ..., x_n))$ . In this course you will mostly see vector fields defined in  $\mathbb{R}^2$  or  $\mathbb{R}^3$ , then you can write it as

$$F = F_1 \mathbf{i} + F_2 \mathbf{j} + F_3 \mathbf{k}$$

etc.

#### **Example:**

Gradient of a scalar function: Let  $f : \mathbb{R}^3 \longrightarrow \mathbb{R}$  be a  $C^1$  function, then

$$\nabla f = \left(\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}, \frac{\partial f}{\partial z}\right) = \frac{\partial f}{\partial x}\mathbf{i} + \frac{\partial f}{\partial y}\mathbf{j} + \frac{\partial f}{\partial z}\mathbf{k}$$

is a vector field, and is called a gradient field.

#### **1.2** Line Integrals

Let C be a curve with parametrization  $\mathbf{r}(t)$  that gives C the counterclockwise direction. Then the line integral of  $\mathbf{F}$  over C is given by

$$\int_C \mathbf{F} \cdot d\mathbf{r}$$

Steps for calculation:

- (i) Substitute  $\mathbf{r}(t)$  into  $\mathbf{F}$ , i.e., find  $\mathbf{F}(\mathbf{r}(t))$ .
- (ii) Differentiate  $\mathbf{r}(t)$  and get  $\mathbf{r}'(t)$ .
- (iii) Evaluate the integral with respect to t, where  $t \in [a, b]$ , i.e.,

$$\int_C \mathbf{F} \cdot dr = \int_a^b \mathbf{F}(\mathbf{r}(t)) \cdot \mathbf{r}'(t) \, dt$$

# Exercise

# Q1

Evaluate  $\int_C \mathbf{F} \cdot dr$ , where

$$\mathbf{F}(x, y, z) = z\mathbf{i} + xy\mathbf{j} - y^2\mathbf{k}$$

along the curve  ${\cal C}$  given by

$$\mathbf{r}(t) = t^2 \mathbf{i} + t \mathbf{j} + \sqrt{t} \mathbf{k},$$

for  $t \in [0,1]$ 

## **1.2.1** Line Integral with respect to dx, dy, dz

Let  $\mathbf{F}:\mathbb{R}^3\longrightarrow\mathbb{R}^3$  be the following vector field

$$\mathbf{F}(x, y, z) = F_1(x, y, z)\mathbf{i} + F_2(x, y, z)\mathbf{j} + F_3(x, y, z)\mathbf{k}$$

and  ${\cal C}$  be the curve

 $\mathbf{r}(t) = r_1(t)\mathbf{i} + r_2(t)\mathbf{j} + r_3(t)\mathbf{k}$ 

then

$$\int_{C} F_{1}(x, y, z) dx = \int_{a}^{b} F_{1}(\mathbf{r}(t))r'_{1}(t) dt,$$
$$\int_{C} F_{2}(x, y, z) dy = \int_{a}^{b} F_{2}(\mathbf{r}(t))r'_{2}(t) dt,$$
$$\int_{C} F_{3}(x, y, z) dz = \int_{a}^{b} F_{3}(\mathbf{r}(t))r'_{3}(t) dt.$$

To summarize,

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \int_C (F_1, F_2, F_3) \cdot (dx, dy, dz)$$
$$= \int_C F_1 \, dx + \int_C F_2 \, dy + \int_C F_3 \, dz$$

# Exercise

Q2

Evaluate the line integral

$$\int_C -y \, dx + z \, dy + 2x \, dz,$$

where C is the helix  $\mathbf{r}(t) = (\cos t, \sin t, t)$  for  $0 \le t \le 2\pi$ .

# 1.3 Work Done

# Exercise

Q3

Find the work done by the force field

 $\mathbf{F} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ 

in moving an object along the curve  ${\cal C}$  parametrized by

$$\mathbf{r}(t) = \cos(\pi t)\mathbf{i} + t^2\mathbf{j} + \sin(\pi t)\mathbf{k}$$

for  $0 \le t \le 1$ .

#### 1.4 Conservative Vector Fields

## **Important properties:**

Let *F* be a continuous vector field in a connected, open set *G* in  $\mathbb{R}^n$ . The following statements are equivalent:

- (i) **F** is independent of path;
- (ii) For any closed curve C is G,

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = 0,$$

(iii) **F** is conservative.

If **F** is conservative, then it is the gradient of a potential function  $\Phi$ , i.e., **F** =  $\nabla \Phi$ . Then

$$\int_{C} \mathbf{F} \cdot d\mathbf{r} = \int_{C} \nabla \Phi \cdot d\mathbf{r}$$
$$= \int_{a}^{b} \nabla \Phi(\mathbf{r}(t)) \cdot \mathbf{r}'(t) dt$$
$$= \Phi(\mathbf{r}(b)) - \Phi(\mathbf{r}(a))$$

The proof above is shown in class, the idea is to use Chain rule in a "reverse" way.

## Important property:

A vector field  $\mathbf{F}$  is conservative if and only if

$$\frac{\partial F_k}{\partial x_j} = \frac{\partial F_j}{\partial x_k}$$

for all j, k. For example, if  $\mathbf{F}(x_1, x_2, x_3) = (F_1(x_1, x_2, x_3), F_2(x_1, x_2, x_3), F_3(x_1, x_2, x_3))$ , then  $\mathbf{F}$  is conservative if and only if

$$\frac{\partial F_1}{\partial x_2} = \frac{\partial F_2}{\partial x_1}, \quad \frac{\partial F_1}{\partial x_3} = \frac{\partial F_3}{\partial x_1}, \quad \frac{\partial F_2}{\partial x_3} = \frac{\partial F_3}{\partial x_2}$$

## Exercises

Q4

Find the potential function (if exists) for the vector field

$$\mathbf{F}(x, y, z) = (y^2 + 4zx)\mathbf{i} + y(2x + 2z)\mathbf{j} + (y^2 + 2x^2)\mathbf{k}$$
