

# MATH1050 Proof-writing Exercise 5

## Advice.

- Study the Handout *Mathematical induction* before answering the questions.
- Besides the handout mentioned above, Question (7a) of Exercise 4 is also suggestive on what it takes to give a correct argument with mathematical induction.

1. In this question, take for granted the validity of the statement below:

(‡) For any  $t, u, v \in \mathbb{R}$ , if  $t > 0$ ,  $u > 0$ ,  $v > 0$  and  $t \neq 1$  then  $\log_t(uv) = \log_t(u) + \log_t(v)$ .

Apply mathematical induction to prove the statement below:

Let  $n \in \mathbb{N} \setminus \{0, 1\}$ , and  $r$  be a real number greater than 1. Suppose  $a_1, a_2, \dots, a_n$  are positive real numbers. Then

$$\log_r \left( \prod_{j=1}^n a_j \right) = \sum_{j=1}^n \log_r(a_j).$$

2. (a) Verify the statements below:

i. Let  $a, b \in \mathbb{R}$ . Suppose  $0 \leq a < b$ . Then  $\frac{a}{1+a} \leq \frac{b}{1+b}$ .

ii. Let  $a, b \in \mathbb{R}$ . Suppose  $a, b$  are non-negative. Then  $\frac{a+b}{1+a+b} \leq \frac{a}{1+a} + \frac{b}{1+b}$ .

(b) Apply mathematical induction to prove the statement below:

Let  $n \in \mathbb{N} \setminus \{0, 1\}$ . Suppose  $x_1, x_2, \dots, x_n$  are non-negative real numbers. Then

$$\frac{x_1 + x_2 + \dots + x_n}{1 + x_1 + x_2 + \dots + x_n} \leq \sum_{j=1}^n \frac{x_j}{1 + x_j}.$$

3. We introduce/recall the definition for the notion of *non-singularity* for square matrices with real entries:

Let  $A$  be an  $(m \times m)$ -square matrix with real entries. The matrix  $A$  is said to be **non-singular** if the statement (NS) holds:

(NS) For any  $\mathbf{x} \in \mathbb{R}^m$ , if  $A\mathbf{x} = \mathbf{0}$  then  $\mathbf{x} = \mathbf{0}$ .

(a) Prove the statement below, with reference to the definition:

Let  $A, B$  be  $(m \times m)$ -square matrices with real entries. Suppose  $A, B$  are non-singular. Then  $AB$  is non-singular.

(b) Consider the statement (\*):

(\*) The product of any two or more non-singular  $(m \times m)$ -square matrices with real entries is non-singular.

i. Fill in the blanks below in such a way that the resultant statement (\*) is a re-formulation of (\*):

(\*) Let  $n$  be an integer greater than 1. Let \_\_\_\_\_ be  $(m \times m)$ -square matrices with real entries. Suppose \_\_\_\_\_. Then \_\_\_\_\_.

ii. Apply mathematical induction to prove the statement (\*).

**Remark.** You may take the result in part (a) for granted.

4. Consider the statement (★):

(★) Every integer greater than 1 is a prime number or a product of at least two prime numbers.

(a) Fill in the blanks below in such a way that the resultant statement (★') is a re-formulation of (★):

(★') Let  $n$  \_\_\_\_\_. For any integer  $m$  between \_\_\_ and  $n$ , the integer  $m$  is a prime number or \_\_\_\_\_.

(b) Apply mathematical induction to justify the statement (★).

**Remark.** You need to recall the definitions for *divisibility* and for *prime numbers*.
