**MATH 3030 Abstract Algebra 2023-24**  
**Homework 1**  
**Due Date: 14th September 2023**

Many of these exercises are adopted from the textbook or reference books. You are suggested to work out more from these or relevant books.

**Compulsory Part**

1. A nontrivial abelian group  $A$  (written multiplicatively) is called **divisible** if for each element  $a \in A$  and each nonzero integer  $k$  there is an element  $x \in A$  such that  $x^k = a$ , i.e. each element has a  $k^{\text{th}}$  root in  $A$ .
  - (a) Prove that the additive group of rational numbers,  $\mathbb{Q}$ , is divisible.
  - (b) Prove that no finite abelian group is divisible.
2. Let  $p$  be a prime and  $\mathbb{F}_p$  be the finite field with  $p$  elements. Compute the orders of the groups  $GL_n(\mathbb{F}_p)$  and  $SL_n(\mathbb{F}_p)$ .
3. Let  $G$  be a group of order  $pq$ , where  $p$  and  $q$  are primes. Show that every proper subgroup of  $G$  is cyclic.
4. Let  $H_1 \leq H_2 \leq H_3 \dots$  be an ascending chain of subgroups of a group  $G$ . Prove that the union  $\cup_{i=1}^{\infty} H_i$  is a subgroup of  $G$ .
5. Let  $H \leq K \leq G$ . Show that  $[G : H] = [G : K][K : H]$ . (*Warning:  $G$ ,  $H$  and  $K$  may not be finite.*)
6. Show that if  $H$  is a subgroup of index 2 in a group  $G$ , then  $aH = Ha$  (as subsets in  $G$ ) for all  $a \in G$ . (*Warning: Again,  $G$  may not be finite.*)
7. Show that if a group  $G$  with identity  $e$  has finite order  $n$ , then  $a^n = e$  for all  $a \in G$ .
8. Show that any group homomorphism  $\phi : G \rightarrow G'$ , where  $|G|$  is a prime number, must either be the trivial homomorphism or an injective map.

### Optional Part

1. Recall that an element  $a$  of a group  $G$  with identity element  $e$  has **order**  $r > 0$  if  $a^r = e$  and no smaller positive power of  $a$  is the identity. Show that if  $G$  is a finite group with identity  $e$  and with an even number of elements, then there exists an order 2 element in  $G$ , i.e. there exists  $a \neq e$  in  $G$  such that  $a^2 = e$ .
2. Using the Theorem of Lagrange, show that if  $n$  is odd, then an abelian group of order  $2n$  contains precisely one element of order 2.
3. Show that every group  $G$  with identity  $e$  and such that  $x^2 = e$  for all  $x \in G$  is abelian.
4. Prove that a cyclic group with *only one* generator can have at most 2 elements.
5. Show that a group with no proper nontrivial subgroups is cyclic.
6. Show that a group which has only a finite number of subgroups must be a finite group.
7. Let  $G$  be a group and suppose that an element  $a \in G$  generates a cyclic subgroup of order 2 and is the *unique* such element. Show that  $ax = xa$  for all  $x \in G$ . [*Hint*: Consider  $(xax^{-1})^2$ .]
8. Let  $n$  be an integer greater than or equal to 3. Show that the only element  $\sigma$  of  $S_n$  satisfying  $\sigma g = g\sigma$  for all  $g \in S_n$  is  $\sigma = \iota$ , the identity permutation. [*Hint*: First show that  $S_n$  is a nonabelian group for  $n \geq 3$ .]
9. Prove the following statements about  $S_n$  for  $n \geq 3$ :
  - (a) Every permutation in  $S_n$  can be written as a product of at most  $n - 1$  transpositions.
  - (b) Every permutation in  $S_n$  that is not a cycle can be written as a product of at most  $n - 2$  transpositions.
  - (c) Every odd permutation in  $S_n$  can be written as a product of  $2n + 3$  transpositions, and every even permutation as a product of  $2n + 8$  transpositions.
10. Show that if  $\sigma \in S_n$  is a cycle of odd length, then  $\sigma^2$  is a cycle.
11. If  $n$  is odd and  $n \geq 3$ , show that the identity is the only element of  $D_n$  which commutes with all elements of  $D_n$ .
12. Consider the group  $S_8$ .
  - (a) What is the order of the cycle  $(1, 4, 5, 7)$ ?
  - (b) State a theorem suggested by part (a).
  - (c) What is the order of  $\sigma = (4, 5)(2, 3, 7)$ ? of  $\tau = (1, 4)(3, 5, 7, 8)$ ?
  - (d) Find the order of each of the permutations given in Exercise 13 (a) through (c) (see below) by looking at its decomposition into a product of disjoint cycles.
  - (e) State a theorem suggested by parts (c) and (d). [*Hint*: The important words you are looking for are *least common multiple*.]

13. Express the permutation of  $\{1, 2, 3, 4, 5, 6, 7, 8\}$  as a product of disjoint cycles, and then as a product of transpositions:

$$(a) \begin{pmatrix} 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 \\ 8 & 2 & 6 & 3 & 7 & 4 & 5 & 1 \end{pmatrix}$$

$$(b) \begin{pmatrix} 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 \\ 3 & 6 & 4 & 1 & 8 & 2 & 5 & 7 \end{pmatrix}$$

$$(c) \begin{pmatrix} 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 \\ 3 & 1 & 4 & 7 & 2 & 5 & 8 & 6 \end{pmatrix}$$

14. Find the maximum possible order for an element of  $S_6$ .
15. Find the maximum possible order for an element of  $S_{10}$ .
16. Complete the following with a condition involving  $n$  and  $r$  so that the resulting statement is a theorem:

If  $\sigma$  is a cycle of length  $n$ , then  $\sigma^r$  is also a cycle if and only if...

17. Show that  $S_n$  is generated by  $\{(1, 2), (1, 2, 3, \dots, n)\}$ .

[*Hint:* Show that as  $r$  varies,  $(1, 2, 3, \dots, n)^r(1, 2)(1, 2, 3, \dots, n)^{n-r}$  gives all the transpositions  $(1, 2), (2, 3), (3, 4), \dots, (n-1, n), (n, 1)$ . Then show that any transposition is a product of some of these transpositions and use Corollary 9.12.]

18. Prove that  $\mathbb{Q} \times \mathbb{Q}$  is not cyclic.
19. Exhibit a proper subgroup of  $\mathbb{Q}$  which is not cyclic.
20. Let  $H$  and  $K$  be subgroups of a group  $G$ . Define a relation  $\sim$  on  $G$  by  $a \sim b$  if and only if  $a = hbk$  for some  $h \in H$  and some  $k \in K$ .
- (a) Prove that  $\sim$  is an equivalence relation on  $G$ .
- (b) Describe the elements in the equivalence class containing  $a \in G$ . (These equivalence classes are called **double cosets**.)
21. Let  $H$  and  $K$  be subgroups of finite index in a group  $G$ , and suppose that  $[G : H] = m$  and  $[G : K] = n$ . Prove that  $\text{lcm}(m, n) \leq [G : H \cap K] \leq mn$ . Hence deduce that if  $m$  and  $n$  are relatively prime, then  $[G : H \cap K] = [G : H][G : K]$ .
22. Let  $\phi : G \rightarrow G'$  be a homomorphism with kernel  $H$  and let  $a \in G$ . Prove the set equality  $\{x \in G : \phi(x) = \phi(a)\} = Ha$ .
23. Show that a nontrivial group which has no proper nontrivial subgroups must be finite and of prime order.
24. If  $A$  and  $B$  are groups, then their Cartesian product  $A \times B$  is a group (called the **direct product** of  $A$  and  $B$ ) using the componentwise defined operation. Is any subgroup of  $A \times B$  of the form  $C \times D$  where  $C < A$  and  $D < B$ ? Justify your assertion.

25. Prove, carefully and rigorously, that a finite cyclic group of order  $n$  has exactly one subgroup of each order  $d$  dividing  $n$ .
26. The **sign of an even permutation** is  $+1$  and the **sign of an odd permutation** is  $-1$ . Observe that the map  $\text{sgn}_n : S_n \rightarrow \{1, -1\}$  defined by

$$\text{sgn}_n(\sigma) = \text{sign of } \sigma$$

- is a homomorphism of  $S_n$  onto the multiplicative group  $\{1, -1\}$ . What is the kernel?
27. Let  $\phi : G_1 \rightarrow G_2$  be a group homomorphism. Show that  $\phi$  induces an order preserving one-to-one correspondence between the set of all subgroups of  $G_1$  that contain  $\ker \phi$  and the set of all subgroups of  $G_2$  that are contained in  $\text{im } \phi$ .
28. Let  $G$  be a group, let  $h, k \in G$  and let  $\phi : \mathbb{Z} \times \mathbb{Z} \rightarrow G$  be defined by  $\phi(m, n) = h^m k^n$ . Give a necessary and sufficient condition, involving  $h$  and  $k$ , for  $\phi$  to be a homomorphism. Prove your assertion.
29. Find a necessary and sufficient condition on  $G$  such that the map  $\phi$  described in the preceding exercise is a homomorphism for *all* choices of  $h, k \in G$ .
30. Let  $G$  be a group,  $h$  be an element of  $G$ , and  $n$  be a positive integer. Let  $\phi : \mathbb{Z}_n \rightarrow G$  be defined by  $\phi(i) = h^i$  for  $0 \leq i < n$ . Give a necessary and sufficient condition (in terms of  $h$  and  $n$ ) for  $\phi$  to be a homomorphism. Prove your assertion.
